

SUSTAINABILITY

With every new architectural design led project comes the opportunity to make a design statement and to demonstrate and realise social and technical progress.

The real issue of environmental protection has come of age in Europe and globally.

The design and construction of buildings and in particular the façade envelope has become of major importance to architects.

In modern building envelopes the façade area usually accounts for 15% of the total construction cost, but is responsible for the largest proportion of energy consumption in terms of cooling, heating, lighting and ventilation.

The main focus of AMS business is the use of our versatile raw material aluminium, which offers a unique combination of characteristics and many technical benefits.

This alongside the products enhanced thermal performance provides a sustainable and energy efficient solution for 21st century project design.

At the end of their lifespan a large proportion of the AMS architectural aluminium systems are totally recyclable.

Architectural & Metal Systems are committed to providing environmentally friendly architectural glazing solutions which are clearly distinguished by their long life service and low maintenance.
