

# Fingershield - Movement of bar type push/panic bars

The clearance between the door frame and the push/panic bar mechanism must be at least 65mm to allow the Fingershield device to operate effectively.

If the clearance is less than 65mm, It is a simple task to reposition the push/panic bar. The lock screw is slackened, the pivot housing is repositioned, the bar is cut shorter and finally the lock screw is retightened.

Moving the bar is **NOT** a service that can be undertaken by a Fingershield fitter as this kind of work is not covered by company insurance.

For Fingershield installations this work must be undertaken prior to company installation.
