SECURITY FOR LUXURY RETAIL OUTLET

A luxury watch retailer was looking to secure an internal section of its new store.

The client was keen to have maximum visibility through any security measure. The layout of the property combined with restrictions based on the building's listing created a challenge for incorporating security shutters.

Stackdoor Corner's 82% free open area and ability to secure corners without intermediate guides made it the product of choice - protecting the high-value merchandise while still being on display. The shutter was powder coated in black to match the luxurious interior design.

DEVELOPMENT CAR PARK ENTRANCE

Car park shutters within residential developments must offer ventilation and a source of natural light.

For this prime residential London development's car park, Stackdoor Standard went above and beyond the requirement for a security measure that catered for ventilation as it

provides up to 80% free open area through stack-and-pin technology.

Rather than rolling up like a regular shutter, the upright stacking feature of Stackdoor Standard eliminates the need for a traditional headbox.

Stackdoor security shutters are manufactured in the UK by CGT Security
