

CUSTOM BRICK™ & BRICK EFFECT

Manufacturing and transporting clay bricks is energy intensive. On site installation commonly involves several trades with the substrate protection and insulation often supplied by others without a single source responsibility or warranty for the performance of the wall. A Dryvit system incorporating either a Custom Brick or Brick Effect finish provides an environmentally superior, simpler, cost effective alternative, from a single source.

Custom Brick utilises a template installed over a coloured base coat prior to the finish application. On removal of the brick template the custom brick is revealed. Custom Brick comes in a variety of options and we can also match an existing building brick or stone pattern and size. Combine this design flexibility with an infinite selection of colours, textures and shading techniques, and your building exterior can look exactly the way you want!

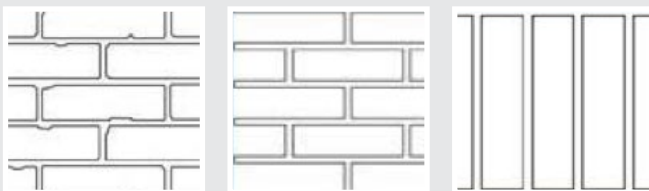

Dryvit Brick Effect is a ready to use polymer modified cementitious render, used to create a brick effect finish. The system is applied in two different coats, the mortar coat and the face coat. The top coat is cut through to expose the mortar base coat, creating the full brick and mortar joint effect. The joints produced are slightly deeper than our Custom Brick finish and it is extremely versatile as joints are cut on site to suit. The finishes are available in a range of typical brick colours to satisfy parochial requirements.
