

Leading the way in
timber frame safety

A unique solution for structural timber frames.

easi-edge have developed a unique solution for structural timber frames. The system is simple to install and provides constant protection from falls from height. Assembled at ground level, the barriers are robust and user friendly and offer the ultimate in work at height safety.

Performance

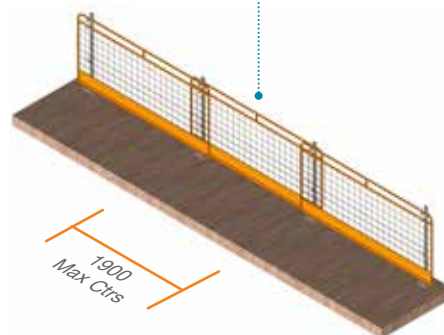

easi-edge offer products and services to solve work at height issues and to meet the Edge Protection Standard BS EN 13374.

Testing has been carried out in line with BS EN 13374 and has proven that the system, with the required fixings, can withstand a pull out force in excess of 20kn. The barriers are lightweight but extremely tough and are highly visible.

The easi-edge system utilises sustainable barriers and components.

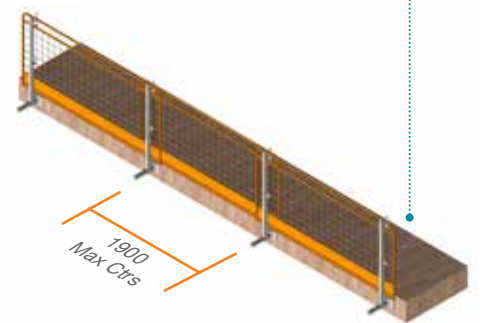

Edge protection – Timber surface fix system

The surface mounted system is fixed to the top surface of the timber allowing edge protection to be 'inboard' of the leading edge and perimeter.

Edge protection – Timber side fix system

The side fix solution allows the system to be secured to the outside edges of the timber. This allows the edge protection to be 'outboard' of the leading edge.

easi-edge do not supply the timber fix screws to install the edge protection as each timber frame has different requirements. All users should carry out their own calculations to identify which timber fix screw is suitable for the type of timber frame and how many are required to ensure system performance. The system has been tested utilising the easi-edge adapter plate.

Edge protection – Soffit bracket system

The soffit mounted system is fixed to the underside of the timber allowing edge protection to be ‘outboard’ of the leading edge and perimeter.

The top of the panel and face of the panel are left exposed which allows other works to be carried out. The system is designed not to obstruct the roof construction.

The installation of easi-edge edge protection has been a great success. Our operatives were able to install the barriers very quickly and efficiently.

The service we have received from easi-edge has been very professional from the start. I have no hesitation in utilising easi-edge products on future projects.

Installation of the system

easi-edge structural timber fix edge protection offers a complete solution which is quick and easy to install. The system eradicates the need for alternative trades during the erection sequence, saving time, money and valuable site resources.

Step 1

The barriers are installed at ground level.

Step 2

The timber panel, complete with edge protection is hoisted into position using a crane.

Step 3

The timber panel complete with edge protection is then fixed into place.

Step 4

The installed timber panel now provides full perimeter edge protection. Any previous line of edge protection or demarcation barriers can be safely removed.

Simple to install, providing constant protection.

System features and benefits

- Ground level installation to reduce the risks associated with working at height
- Proven to reduce up to 30% off the erection time
- Lower labour costs
- Quick and efficient installation - saving time and money
- Sustainable barriers and components
- Complies with edge protection standard BS EN 13374
- Total project management including technical detailing
- On-site support available throughout your project
- Full training available to accredited standards

The system minimises the risks of working at height, it is faster to install and more versatile than traditional scaffolding edge protection.

Senior Project Manager
Kier Eastern

Eurban have now used the easi-edge system on numerous projects. Its quick fixing and versatility has been invaluable to our site teams high level of safety when erecting solid timber buildings. It has allowed us to complete high risk and complex buildings in a safe manner.
