Site Safety – with experience, quality and service

easi-edge are a leading site safety solutions company, providing products that protect perimeter edges, internal voids, roofs, stairs, lift shafts, vehicle offloading and loading bays.

Part of a long established group of construction companies, we can trace our history back many years, over which we have applied our expertise and experience, listened to our valued clients and developed what we believe are optimum industry solutions.

We are founding members of the Edge Protection Federation and our mission is to make working at height safe for all Main Contractors and Subcontractors.

Our commitment to excellence through both superior product quality and a complete dedicated project service is unparalleled. All products are designed by chartered structural engineers and rigorously tested. Our experienced people are able to offer you advice on solutions to your working at height issues. We underpin our commitment through ISO 9001, 14001 and OHAS 18001.

And what's more, we also offer a simple pricing system where we provide a quote with no hidden extras once the project has begun.

We offer a simple pricing system with no hidden extras

The easi-edge difference

We design, fabricate, manage and hire quality products to provide practical industry leading solutions to all your working at height issues.

easi-edge products are designed to conform to Working at Height Regulations 2005 and the British and European Standard for temporary edge protection (BS EN 13374) Class B. We believe that this makes us unique as we are unaware of any other products that conform to this high level of design specification. In addition, our products are tested by Lloyds British and Lloyds Register.

We provide project specific solutions to solve your working at height issues. Our dedicated Project Managers can take your preliminary drawings or 3D model, propose and even detail a scheme for site safety that can be easily incorporated during the fabrication and erection or general construction process.

The easi-edge team will co-ordinate all deliveries to your site to suit project phases, with continued on-site support provided by experienced NEBOSH, IOSH and CSCS certified Field Engineers.

A unique and comprehensive product range

easi-edge

Edge protection barriers for complete perimeter protection. Our edge protection system can be installed from ground level and offers total protection at all stages of the build. Providing a flexible solution, a variety of fixings are available to suit structural steel, timber and concrete frames. In situ for the majority of the construction process, our barrier system compliments follow on trades, minimising the risks associated with working at height.

easi-stairs

Edge protection barriers for stairs and landings. As a surface mounted stair solution, the complete stair unit is lifted into position using a crane. The solution provides easy and safe access to the building when the stair is set in position.

On completion of construction works the modular system easily dismantles for trouble free and safe removal.

easi-access

A gate and supporting frame compatible with perimeter edge protection at all levels, designed to provide controlled access to site personnel. The access gate is suitable for pedestrian segregation or enabling access to different areas on site.

Site access can be further controlled with the easi-ped surface mounted pedestrian barrier system, which is also suitable for demarcation.

core-safe

Edge protection to secure lift shaft voids. The core safe gate provides full coverage from slab to lintel, with a double gated system for extra safety and controlled access. Comprising a lockable outer gate with fine mesh infill panel to prevent debris falling into the lift shaft, the core-safe design also incorporates an up and over inner gate, complete with kick flat to provide extra safety.

bay-master

Edge protection for elevated loading bays. A unique design uses a pivot mechanism to make loading and unloading at height safer, constantly protecting workers and materials from falling through exposed gaps. This simple, but effective solution is built to withstand the construction environment and is ready for use in record time.

trail-arrest

A solution to protect from falls from vehicle trailers. The robust steel frame and strong safety netting has been designed to protect workers from injury as they load and unload vehicles on site. Fixed by means of a simple G Clamp, allowing flexibility, the whole system is easy to install and dismantle, and can be packed away to be easily relocated to another project.

Supported by industry leading service

Put simply, we provide total project management, technical detailing and dedicated support throughout the project as well as problem solving. During our initial meeting with you we will discuss every detail and timings associated with the project.

Above all, we will look carefully at your plans, recognising any areas of potential safety dangers and discuss with you all the options to eliminate hazards. Discussing the plans, we can identify your needs and look at the positioning of edge protection needed on each floor and whether you need

protection on the outside or interior of the build.

We can supply drawings showing what solutions are needed. Our team can provide a comprehensive scheme to suit the complexity of your build.

Extensive planning is done well in advance so that by the time the equipment is on site all eventualities have been worked through. We will even plan the transfer of the hire of equipment right at the beginning so that it ensures the smooth running of the project right through to the dismantling and removal stage.

We pride ourselves on our high standards of project management. You will benefit from being able to call upon a designated Project Manager. Our dedicated team will oversee the technicalities of the project and our Field Engineers will inspect the site going forward.

We work with you to eliminate all potential hazards

Peace of mind

- 10 Years of accident free installations
- A complimentary range of solutions available to ensure safe and effective work at height
- Class leading solution – our barriers exceed the requirements of BS EN 13374
- Preferred edge protection provider to Main Contractors and specialist Subcontractors
- Ultimate protection for site personnel on all floor levels including rooflines
- Robust barriers that are highly visible
- Scheduled inspections for extra safety assurance

Time saving

- Straightforward quotations returned within 48 hours
- Quick to install and dismantle
- Seamless transfers of hire to other site Contractors
- Colour coded installation plans supplied with each delivery
- In-house design and detailing capabilities
- Multiple fixing solutions for steel, timber and concrete frames
- System comprises the same fixings that are used during the frame construction

Cost benefits

- Project specific engineered solutions
- FREE advice from our experienced team, coupled with a complete Project Management service
- TEKLA, AutoCAD and StruCad expertise
- Dedicated Technical Manager for each project
- Guaranteed availability
- Phased deliveries and collections to suit construction programme
- On-site training by our experienced Field Engineers

We take pride
in the standard
of service we
provide

Easi to take the next step

Step 1

Email your build drawings or enquiry through to:
enquiries@easi-edge.co.uk

Your drawings can be in any of the following formats – PDF or DWG, alternatively easi-edge can also accept a Tekla model (DB1 file) or a StruCad model (SNF).

Step 3

If required, an easi-edge representative will visit your site to go through all of the requirements with you.

Step 2

Within 48 hours we will send you your quotation. Open the email sent by our Sales department to find your project drawings quantified and marked up by easi-edge with a comprehensive quotation.

This will include a fully detailed breakdown, floor by floor, along with transport costs and any further services we can offer.
