

In 1988 a new footbridge was built to replace the original which had been in place since Victorian times. The new bridge was galvanized by Highland and remains corrosion free to this day. However, the same cannot be said about the gates which were added some years later.

If you fail to specify then cost will be the deciding factor. Lack of adequate corrosion protection will mean increased maintenance and eventually costly replacements. Galvanizing is the worlds oldest and best form of corrosion protection.
